ABSTRACT:

A mechanism to isolate and externalize the definition of business rules, and to support them using visual programming techniques (special editors for Java beans). This means that the rules can be set up by a business expert who does not need specialized programming skills. In addition, the Java beans are preferably implemented as dynamic Java beans.

TITLE: Ordering relational database operations according to referential integrity constraints

DATE-ISSUED: April 1, 2003

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Salo; Timo J.	Apex	NC		

US-CL-CURRENT: 707/1; 707/104.1

ABSTRACT:

A method, system, and computer program product for increasing the efficiency of operations that are to be performed against an arbitrary relational database by automatically ordering the operations according to the referential integrity constraints defined for the affected tables. Because the ordering is performed programmatically, the application developer is relieved of the burden of attempting to structure the application in a manner that avoids violating the referential integrity constraints. The efficiency of modifying the database increases significantly using this technique. The ordering may be performed at a database engine. Existing applications may take advantage of this ordering technique, without requiring change to the application itself. Batch-mode write operations are possible when using this technique, thereby reducing the number of network round-

trips that must be performed.

TITLE: Method and data processing system for specifying and applying rules to classification-based decision points in an application system

DATE-ISSUED: January 22, 2002

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Degenaro; Louis Ralph	White Plains	NY		
Ehnebuske; David Lars	Georgetown	TX		
McKee; Barbara Jane Alspach	Austin	TX		
Rasmus; Kevin Paul	Bloomington	IL		
Rouvellou; Isabelle Marie Catherine	New York City	NY		

US-CL-CURRENT: 717/117; 706/47

ABSTRACT:

A method and apparatus for specifying, applying and managing rules used by an application in a data processing system are provided. A set of classification categories are specified, each classification category representing a different purpose of classification. A set of classifications are specified, each classification representing a possible outcome of an act of classifying. A set of control point names are specified, each name being associated with one or more control points in the application. A set of classification rules are specified, each such rule being associated with a classification category and said rule being adapted to analyze the state of the application and classify it by returning one or more classifications. A set of decision rules are specified, each such rule being associated with a classification and a control point name, said rule being adapted to affect the behavior of the application by calculating a value or making a decision. A set of control points is specified and built into the application at those points in the application flow at which variability of behavior controlled by rules is desired, each such control point being associated with a control point name and one or more classification categories. During the running of the application, when a control point as described above is encountered, the control point's associated classification categories are used to select that set of classification rules associated with any of the classification categories and the selected classification rules are then run.

TITLE: Network device information collection and change detection

DATE-ISSUED: September 19, 2000

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Babu; Vidya	Saratoga	CA		
Fredrich; Michael F.	Fremont	CA		
White; Christopher A.	Saratoga	CA		

US-CL-CURRENT: 707/103R

ABSTRACT:

Mechanisms for network device information collection and change detection are disclosed. A data Collection Engine is coupled to a database and a network having comprising devices such as switches and routers. The Collection Engine receives a network device name and queries the network to locate the named device. Based upon a device type identifier, the Collection Engine identifies the class of the device and a group of information sets that describe information needed from the device. The Collection Engine requests information described by the information sets and stores it in the database. A change detection mechanism compares the received information to a prior version in the database, and develops metadata describing changes in the versions. Accordingly, only a subset of all the information that a device can deliver is received and stored, based on the needs of an application using the mechanisms. A carrier wave may carry software program instructions that carry out the foregoing functions from a remote location.

ABSTRACT:

A distributed garbage collection system and method is disclosed that is compatible with local ref-count or full garbage collection and that ensures that no local object's storage is deleted by the local garbage collector unless it is certain that there are no actual or potential remote references to that local object. The disclosed system and method are implemented in the context of a transparent distributed object system in which communications between objects in different processes are enabled by dedicated proxy objects that are linked to corresponding remote objects via a pair of transport objects. Additional proxy holder objects and proxy holder proxies ensure that objects for which third-party object references are passed (i.e., where one object in a first process passes a remote object in a second process a reference to a third object in a third process) are not collected until a direct link is established between the remote object in the second process and the third object in the third object space. As appropriate, secret number table pointers maintained by a local registrar for each object that has been accessed via a third party message are deleted, allowing the objects to be collected when there are no other actual or pending remote references to that object. The transport managers encrypt all inter-process messages so as to provide full capability security within the distributed system. This enables the disclosed garbage collection system and methods to operate under attack from misbehaving participants.

TITLE: Capability security for distributed object systems

DATE-ISSUED: December 22, 1998

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Miller; Mark S.	Los Altos	CA		
Tribble; E. Dean	Los Altos Hills	CA		
Hardy; Norman	Portola Valley	CA		
Hill; Eric C.	Palo Alto	CA		
Hibbert; Christopher T.	Mountain View	CA		

US-CL-CURRENT: 713/167; 713/150, 719/310, 719/315

ABSTRACT:

A system providing capability security for distributed object systems is disclosed. The basic tenet of capability security is that the right to do something to an object (e.g., invoke a particular object's methods) is represented solely by the holding of a reference to that object. In each of the preferred embodiments described herein, an object is presumed to hold legitimately a reference to a particular object only if the object knows some unpublicized (except under the conditions required by capability security) key associated with the particular object. That is, an object's key is required along with the object's reference. So that capability security is preserved when object references are passed between objects in different processes, the object references being passed are encrypted upon transmission and then decrypted upon arrival at their intended destination. This cryptography can be performed by objects or processes using a variety of techniques, including Diffie-Helman or public/private key cryptography. The cryptography performed in the various embodiments ensures that only the intended recipient of the message can decode the object reference and that a misbehaving object cannot convince another object that it possesses a capability it does not have. Some of the disclosed embodiments provide capability security for distributed object systems wherein the objects and processes directly handle inter-object and inter-process communications and message encryption and decryption.

TITLE: Data village system

DATE-ISSUED: July 7, 1998

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Emerson; Mark L.	Los Angeles	CA	90066	

US-CL-CURRENT: 707/100; 707/201

ABSTRACT:

The data village system (DVS) comprises an interactive computer system and software that enables a user to establish a data model that defines an organizational structure for an organization's data and that enforces the user's rules as to how the organization's data is manipulated and viewed. The data model for any organization, in its simplest form, consists of tables for receiving related datums, compartments of tables for receiving associated datums, and cables which connect tables thereby indicating linkages between datums in different tables. This basic conceptual underpinning can be expanded to groupings of linked tables into rooms, groupings of linked rooms into houses, and groupings of linked houses into data villages, a data village corresponding to the organization to which the data model pertains. The DVS provides the means for a user to define a data model for an organization in terms of compartments, tables, rooms, houses, and the interconnecting cables. The DVS functions in accordance with data organization rules which require that any user-data entered into a compartment be linked to other user-data in accordance with the data model. As a result of this organizational scheme, a user may request the display of the datums in a specified compartment and be alerted to and have available for display all other datums in the organization that pertain to the datums in the specified compartment.

TITLE: Apparatus for design of a multilevel secure database management system based on a multilevel logic programming system

DATE-ISSUED: January 2, 1996

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Thuraisingham; Bhavani M.	Lexington	MA		

US-CL-CURRENT: 707/9; 706/45, 706/46, 706/50, 715/533

ABSTRACT:

Apparatus for designing a multilevel secure database management system based on a multilevel logic programming system. The apparatus includes a multilevel knowledge base which has a multilevel database in which data are classified at different security levels. The multilevel knowledge base also includes schema, which describe

the data in the database, and rules, which are used to deduce new data. Also included are integrity constraints, which are constraints enforced on the data, and security constraints, which are rules that assign security levels to the data. The system further includes users cleared to the different security levels for querying the multilevel database, and a multilevel logic programming system is provided for accessing the multilevel knowledge base for processing queries and for processing the integrity and security constraints. The multilevel database management system makes deductions and gives complete answers to queries and prevents certain unauthorized inferences.

TITLE: System and method of constructing models of complex business transactions using entity-set variables for ordered sets of references to user data

DATE-ISSUED: September 28, 1993

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Bachman; Charles W.	Lexington	MA		
Gane; Christopher P.	New York	NY		
Krieger; David A.	Cambridge	MA		
Abramovich; Igor	Medford	MA		

US-CL-CURRENT: 707/104.1

ABSTRACT:

A computer system for building models of complex business transactions in an information management system. The system includes storage means for storing ordered sets of references to design data, such as entities. The ordered sets, or entity-sets, are assigned a value, and may then be manipulated in a manner similar to a data variable. The references may be ordered in accordance with predetermined criteria, or operator selected criteria.

US-CL-CURRENT: 703/2; 707/1

ABSTRACT:

A computer system for creating and manipulating subsets of dynamic information systems models of organizations. Generally, the system includes a plurality of dynamically linked modelers. The system includes a filter for creating a subset of a model. Each model subset is defined by operator-determined selection criteria. The subset is created by applying the selection criteria to the design data set of the model to be filtered. The resulting model subset may be displayed in a graphical representation. Such representations may enable the user to dynamically interact with the system.

TITLE: System for establishing concurrent high level and low level processes in a diagram window through process explosion and implosion subsystems

DATE-ISSUED: May 18, 1993

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
------	------	-------	----------	---------

Gane; Christopher P. New York NY
Krieger; David A. Cambridge MA

US-CL-CURRENT: 715/854; 700/8, 715/803, 717/104

ABSTRACT:

A computer system for creating and manipulating subprocesses in a dynamic model of information management systems of organizations. The system enables a user to "explode" a process from a graphical representation, or diagram, into its corresponding subprocesses. By performing this process explosion, high-level processes and primitive processes are created. A high-level process is one which has one or more corresponding subprocesses, whereas a primitive process is one which has no corresponding subprocesses. A diagram may then be generated for each primitive process. In addition, the resulting exploded process may simultaneously be displayed with the displayed process from which it is derived. In a similar fashion, subprocesses may be "hidden" within a process, creating high-level processes from groups of primitive processes.

TITLE: Adaptive window system for dynamically modeling information systems

DATE-ISSUED: March 16, 1993

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Krieger; David A.	Cambridge	MA		
Micco; John T.	Watham	MA		

US-CL-CURRENT: 715/809; 715/810

ABSTRACT:

A computer system for establishing an adaptive window system within a dynamic model of information systems of organization. The system includes a plurality of editors which enable a user to interact with the system. The window system includes predetermined criteria against which design data of one or more of the editors is compared. An options window then displays those options which meet the criteria, generally corresponding to syntactically permissible options, at any time during the model building process.

TITLE: System for accessing design data of modeler subsystems by reference to partnership set and for dynamically correlating design data of modeler subsystems

DATE-ISSUED: March 9, 1993

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Bachman; Charles W.	Lexington	MA		

US-CL-CURRENT: 707/1; 715/533

ABSTRACT:

A computer system for dynamically modeling information systems of organizations by employing partnership sets. The system includes one or more editors which enable a user to interact with the system. The system includes a programmed data computer adapted to establish one or more partnership sets within at least one design data, where each partnership set is representative of zero, one or more partnerships. The computer is further adapted to establish one or more partnerships, wherein each partnership is characterized by one partnership set associated with itself or associated with one other partnership set. The computer controls access to one or more design data by reference to a partnership set which is in partnership with partnership sets of one or more design data.

US-CL-CURRENT: 707/100

ABSTRACT:

A computer system for processing information representative of complex business transactions. The system enables a user to define business logic within a dynamic information management system model. The system may include a plurality of editors which enable a user to dynamically create, analyze and modify design data. The system further includes graphical displays which enable a user to affect the operations to be performed on that design data.

TITLE: System for transforming user data in accordance with an algorithm defined by design data and for evaluating the transformed data against logical criteria

DATE-ISSUED: January 12, 1993

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Bachman; Charles W.	Lexington	MA		
Krieger; David A.	Cambridge	MA		

US-CL-CURRENT: 707/4; 706/62

ABSTRACT:

A computer system for processing complex information representative of business transactions. Specifically, the system stores transaction data, which is then reversibly transformed in accordance with predetermined processing algorithms, while it is externally inaccessible. In this static state, the transformed transaction data is evaluated against predetermined logical criteria. The evaluation produces either successful or unsuccessful results. If successful, the transformed data is then made externally accessible. If unsuccessful, the original transaction data is made externally accessible.

US-CL-CURRENT: 707/102; 707/104.1, 717/104, 717/109

ABSTRACT:

A computer system for dynamically modeling information systems of organizations. The system includes a plurality of editors which enable a user to interact with the system. Included in the system is an information modeler, an information flow modeler, and a logic modeler for creating, analyzing and modifying design data associated with each modeler. Each of the modelers are dynamically interlinked, such that a change to one design data set will affect a corresponding change in other design data sets. The system includes graphic representations associated with each of the modelers to enable a user to interact with the system. The objects of each of the graphic representations may also be dynamically linked, such that a change in one representation affects a substantially immediate change in other representations.
